Help on Zoom-In

This option draws one or more series that have chosen by the user (from the left panel). The figure type can be changed from dots (the default) to lines, bars, stacked line (see the figure below), and stacked bars.

Use the sliders to change the frequency (days/weeks/months/quarters/years) and the sample data as well. One of the prominent advantages of this option is the interactive Zoom-In capabilities. Every move of the mouse within the figure frame changes the values of the figure's contents located at the upper center of the figure. One can also examine part of the figure (Zoom In) by 'click and brush' the interesting area (hold the left click of the mouse and drag the mouse over the required area). Double click will reload the original data. Another advantage is saving the figure for later examination in an HTML file type, once the user press the 'Save' key (located at the left bottom side of the figure). The file is saved, like all other outputs, in AWS s3 under your email address folder. An example of Zoom-In figure is depicted below.
